ABSTRACT

A method, apparatus and computer program products are provided for providing video data. One example method includes receiving sensor data from one or more mobile terminals, analyzing the sensor data to determine whether to utilize video data captured by or able to be captured by at least one mobile terminal, and generating video content comprising video data captured by at least one mobile terminal. The video content may be a real time video broadcast, comprising live or near live data during one or more periods of time when a mobile terminal is able to capture a target and previously recorded video data of one or more events during one or more periods of time when a mobile terminal is not capturing the target.
